*Forklift Bumper system moves more profit to the bottom line.*

## Next Generation Fork-Kushions®

In 2003, Kastalon answered the cry of their clients by introducing the world's first comprehensive cargo bumper system for forklift trucks with the introduction of Fork-Kushions.

For nearly 3 years, Fork-Kushions have been dramatically reducing damage and improving profits by providing cushioning protection from marring, denting and other forms of damage.

Fork-Kushions are simply mounted directly to the upright face of the fork utilizing specifically designed permanent mounting brackets.

The brackets are equipped with a high performance quick adhesion system providing easy in-house installation. The cushion then slides into the bracket.

Always seeking to provide the best possible solutions for their customers, Kastalon just

introduced the next generation Fork-Kushion that makes the installation process even easier with a specifically designed adhesive primer and the latest generation industrial grade VHB tape.

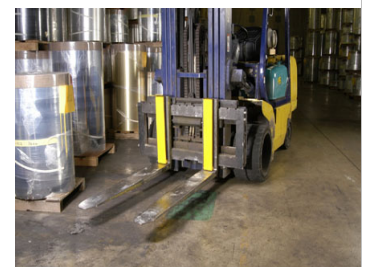

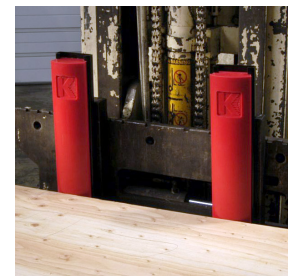

Now, it is simpler to get optimum bond strength under real world industrial conditions.

## Which one to choose?

There are 5 unique styles to choose from satisfying virtually every material handling application.

The "Ultra Soft" offers dense cushioning for fragile handling. The "Soft" is best suited for lightweight material and the "Medium" is considered all-purpose. In addition, there is a "Cut-Resistant" style as well as a "Maximum-Impact" style for extremely heavy objects, such as steel coils and the like.

To best determine which bumper corresponds to your load requirements, contact Kastalon client relations and discuss the specifics of your environment. They will be happy to provide you with a free sample to consider.

## No more slammin' doors!

Exemplifying manufacturing excellence, a residential and commercial door manufacturer felt it important to address the scratches and dents caused by the forklifts transporting their product throughout the production facility and shipping area.

The challenge was to find a process improvement that could realistically and economically prove effective, and increase the volume of quality going out the door.

Having heard of the new, innovative bumper system developed by Kastalon, Inc, the plant management enlisted their assistance in matching the right bumper for their application.

Based on the type of damage that was occurring, Kastalon recommended the "Soft" model to absorb the doors' impact without scratching.

Within the first 30 days, the reduction in damage was so significant, that management issued a mandate that all forklift trucks be outfitted with a set of Fork-Kushions.
